

Monitoring, Assessment, Prediction and Meteorological service of Agricultural Drought in China

Wang Shili
China Meteorological Administration

January, 2005, Kobe

Content

- **Characteristics of agrometeorological Drought**
- **Monitoring of Drought**
- **Risk Assessment of Agricultural Drought**
- **Prediction of Agricultural Drought**
- **Meteorological Service for *Mitigating* Agricultural Drought**
- **Conclusions**

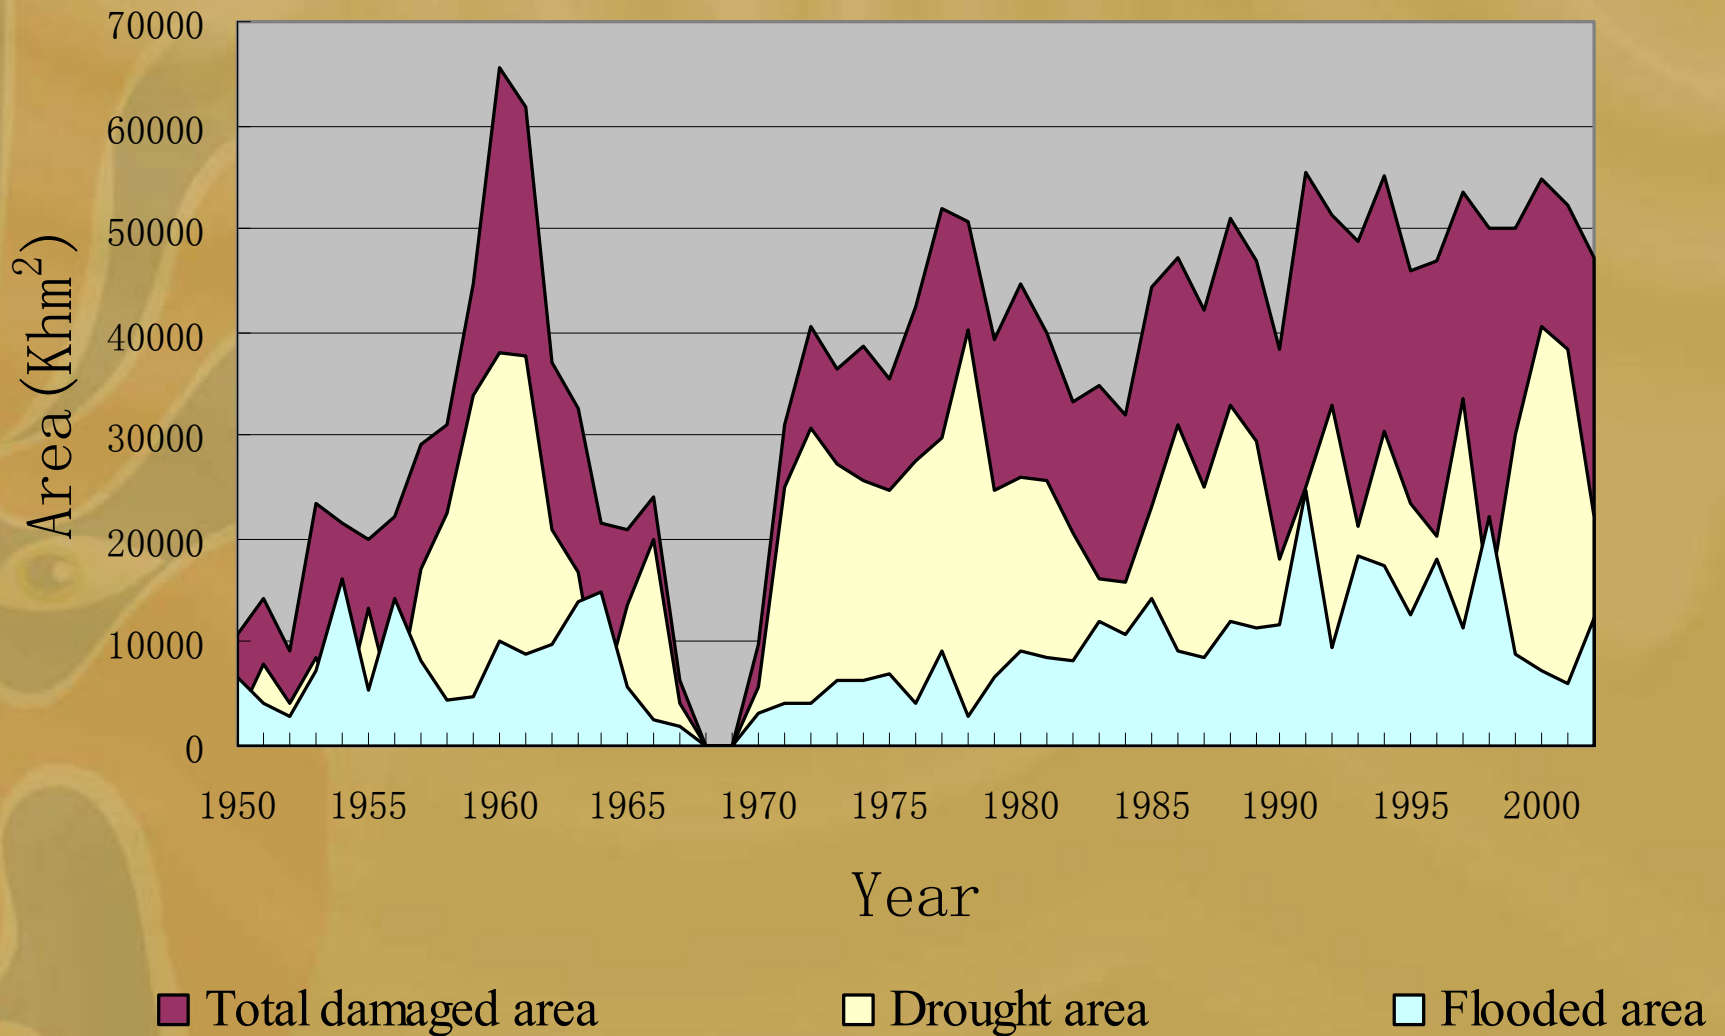

Drought is one of the most severe meteorological disasters

With characteristic of slow development, long duration, wide *stricken* area and severity.

Significant impact on hydrology, agriculture, eco-environment, economy and society

Compared with average in 1950-1990, drought damaged areas increased 33%, flood damaged areas increased 89% in 1990-2000

(1) Characteristics of Agro-meteorological Drought in China

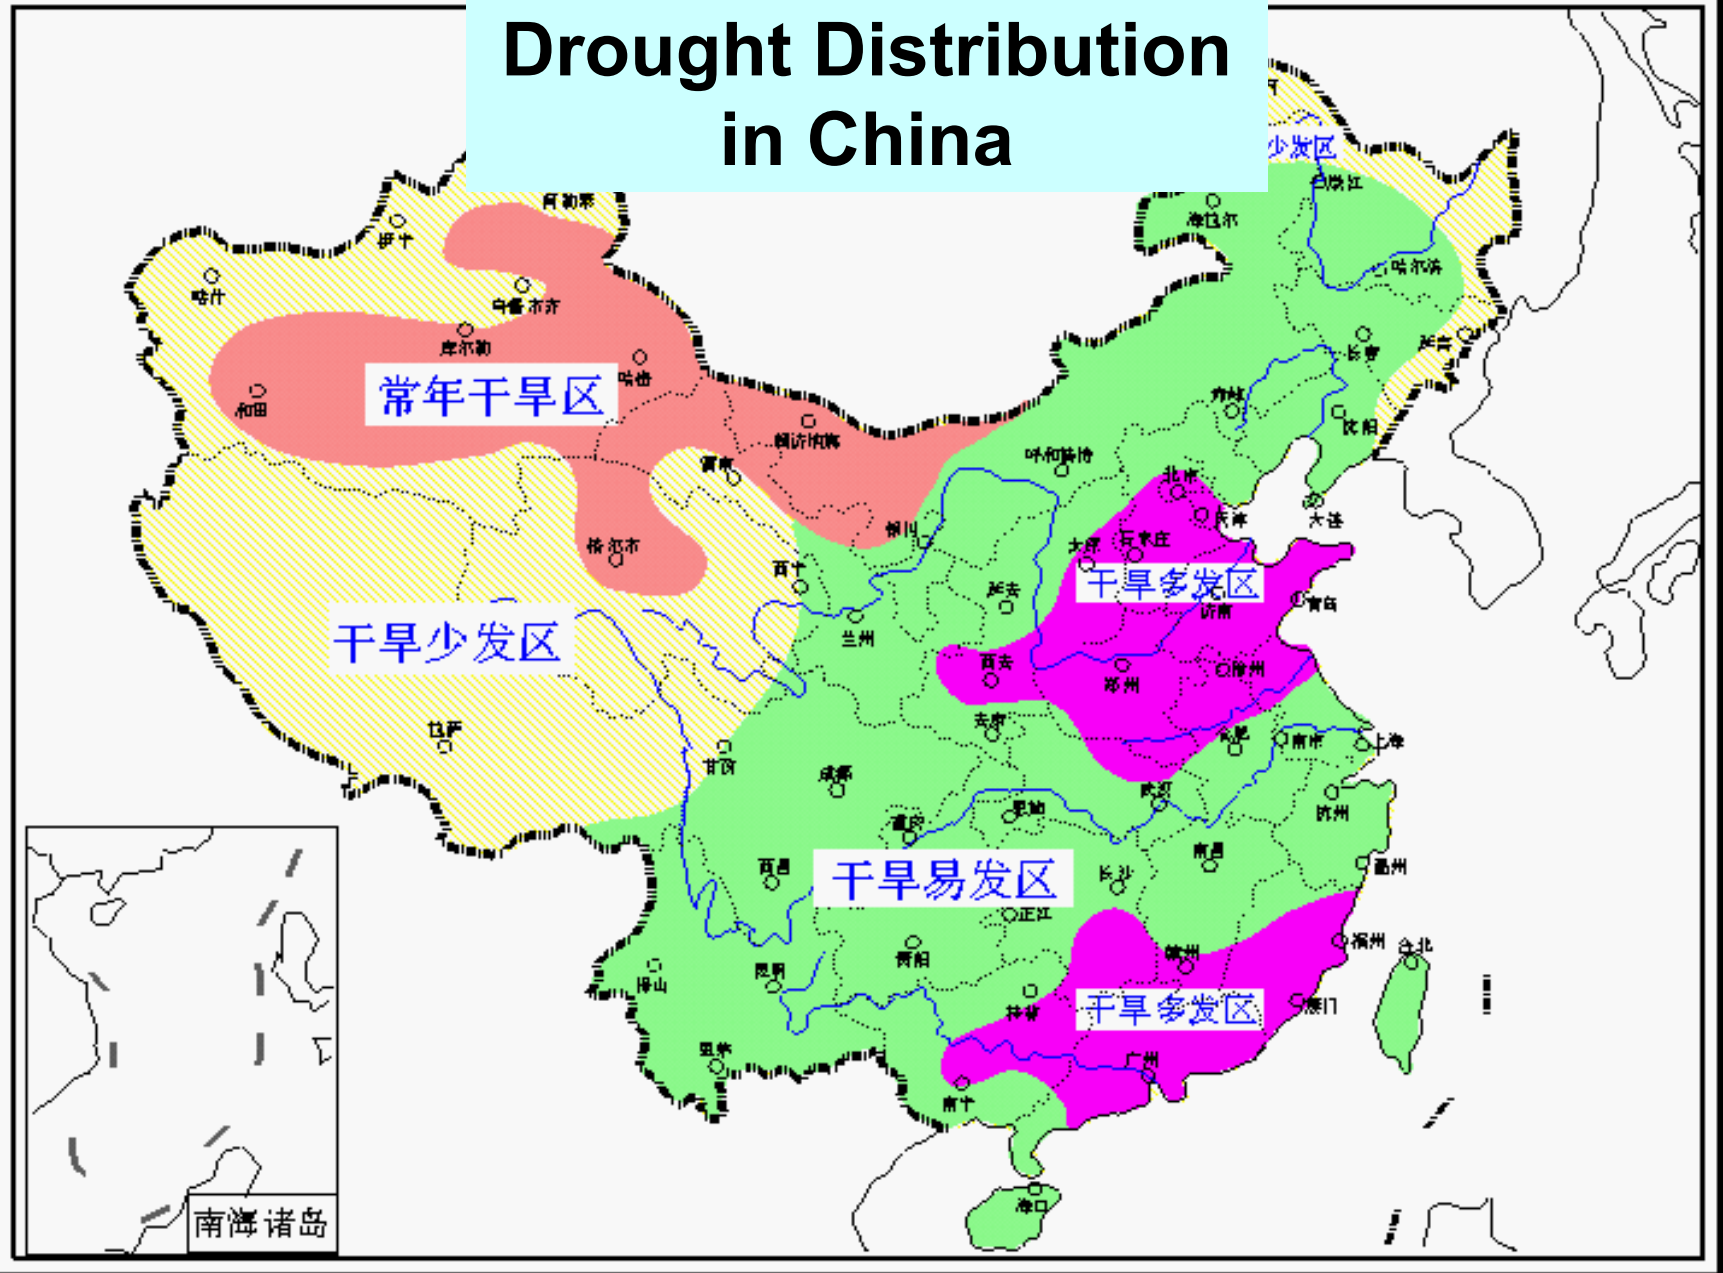

Seasonal and Regional Feature:

- **Large territory**
- **Different climate type (spatial and temporal distribution of precipitation, variability)**
- **Various agriculture style (crop varieties, cropping system, water requirement)**
- **Different water supply conditions for agricultural crops**

Type of agricultural drought

- **Spring drought of winter wheat in North China**
- **Summer drought of rice in southern China**
- **Summer drought of autumn-matured crops**
- **Autumn drought of rice in southern China and drought in sowing period of winter wheat in North China**
- **Winter drought of over-winter crops in South China**

Drought Distribution in China

Wheat, MAY. 2004 Henan

Rice, 17,Oct. 2004 Guangxi

Fruit trees, Oct. 2004 Guangxi

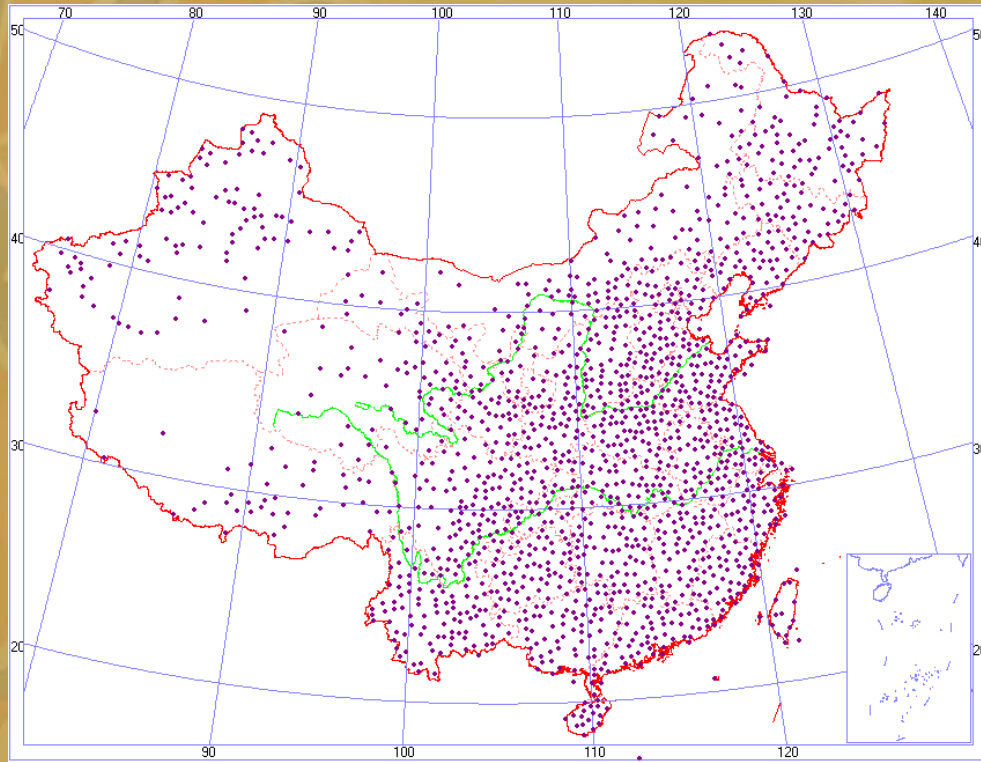

Sugar cane, 25,Oct. 2004 Guangxi

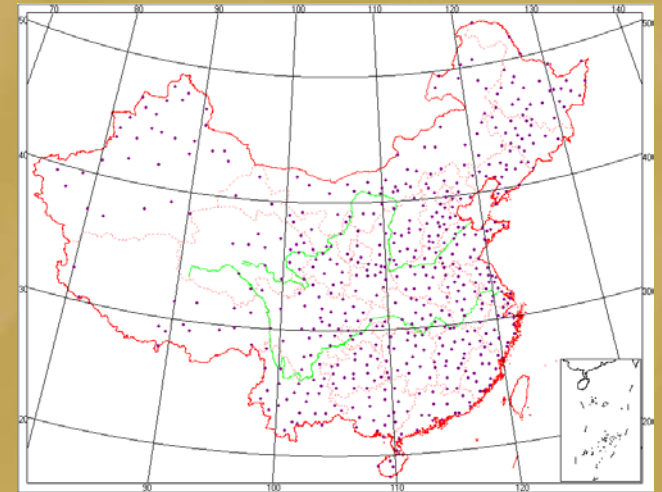

(2) Monitoring of Drought

- **Drought Monitoring based on Station Network**
- **Drought Monitoring Using Remote Sensing Technique**
- **Experimental site aiming at agricultural drought**

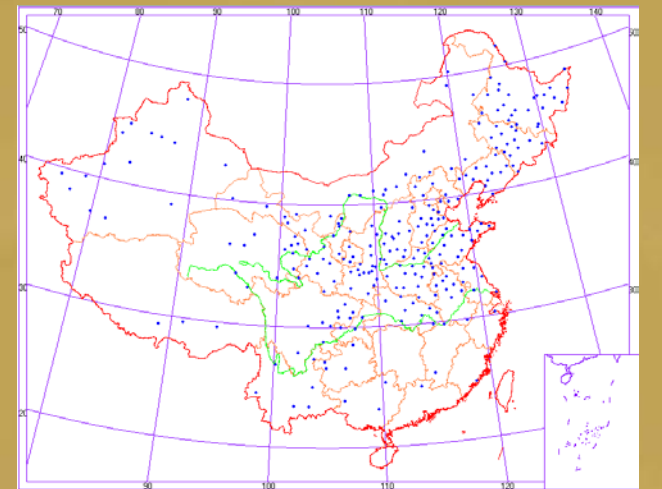

Drought Monitoring based on Station Network

Weather Stations in China

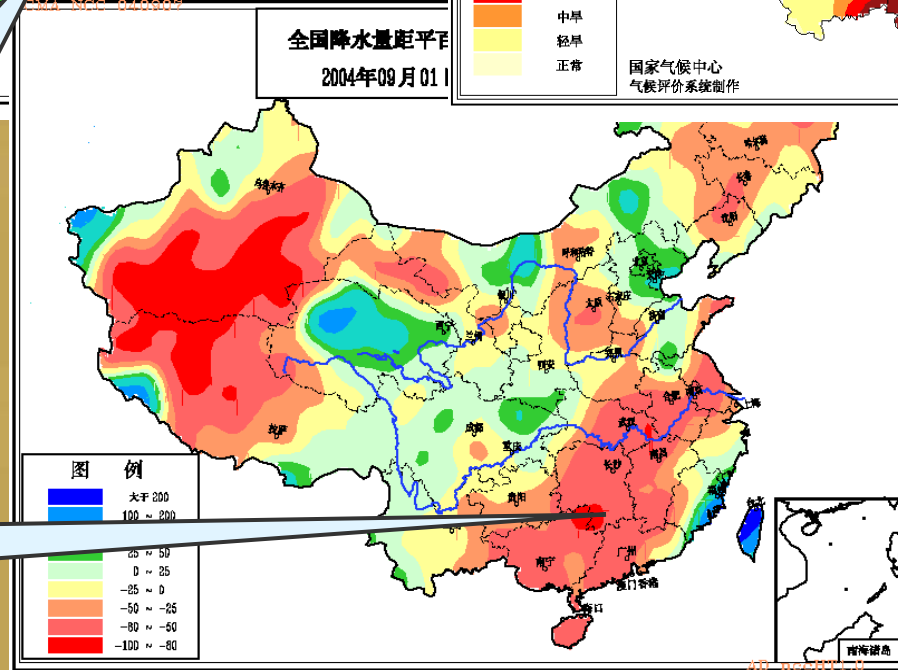

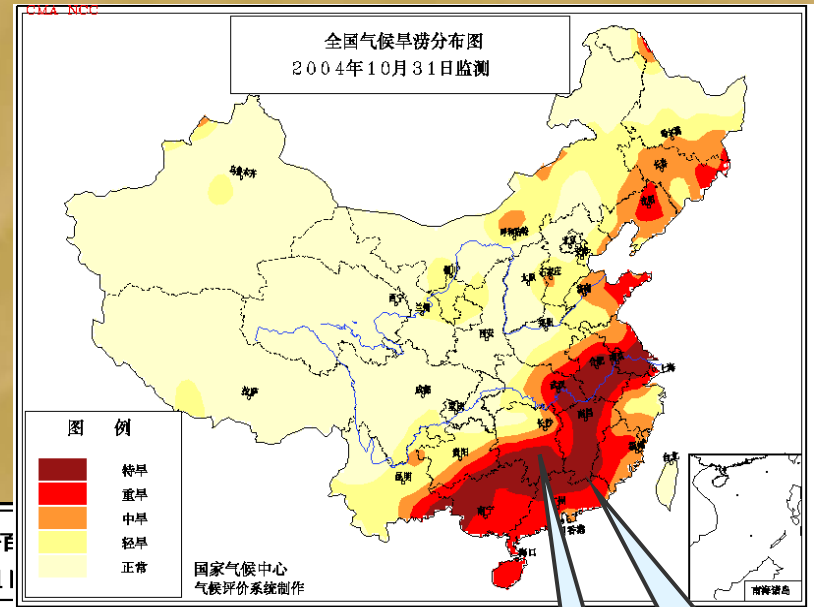

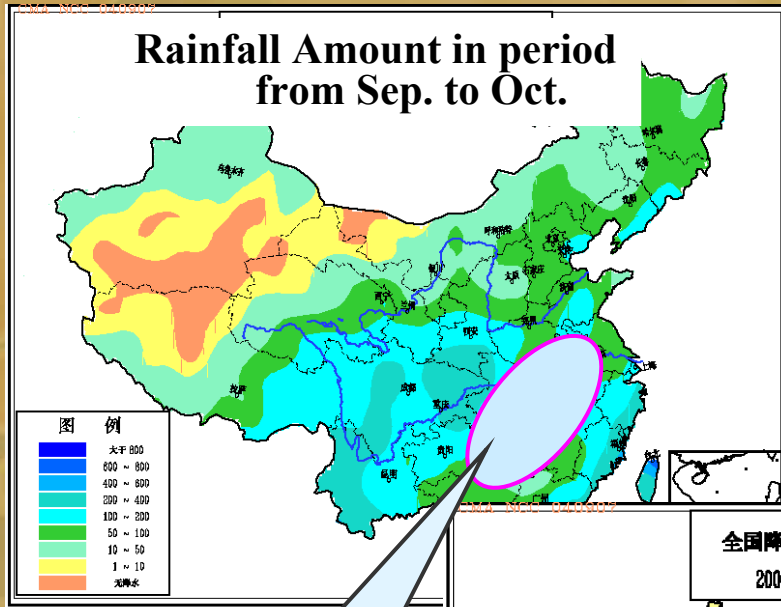

Agro-meteorological Stations

Soil Moisture Observation Stations

Precipitation, abnormality, drought index from Sep. to Oct. 2004

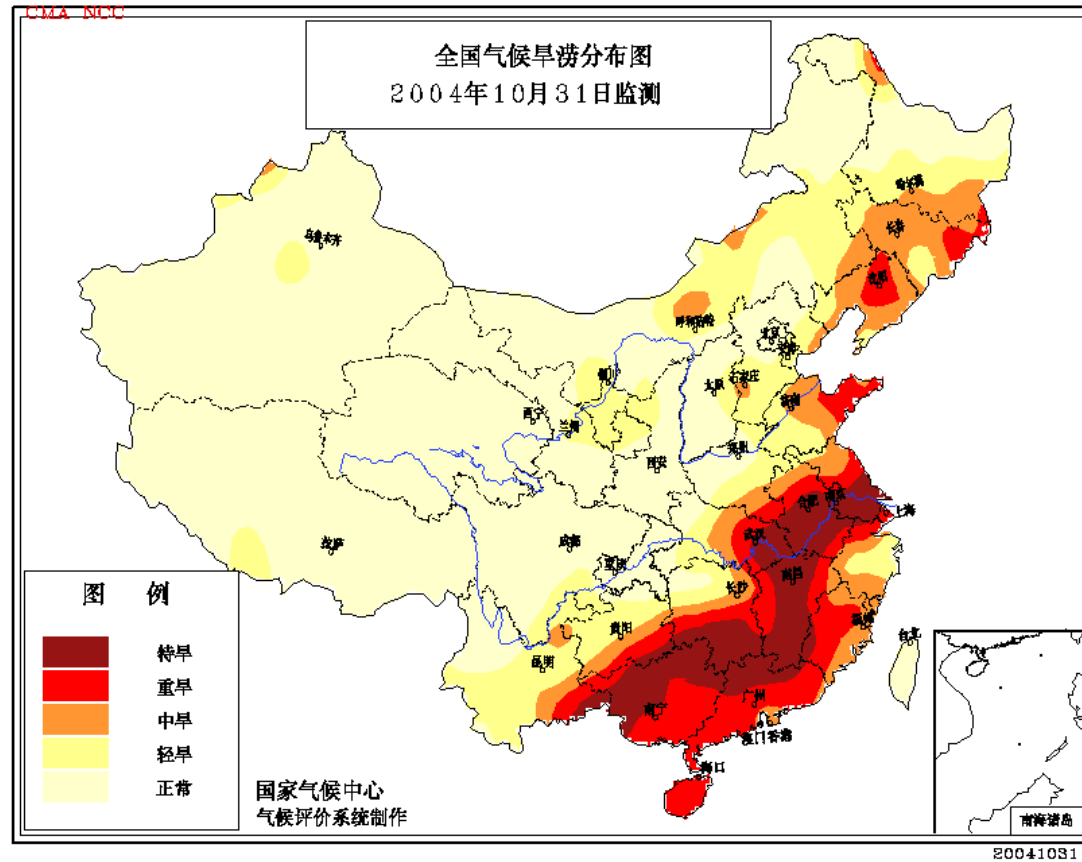

Rainfall <100mm

anomaly
-50%

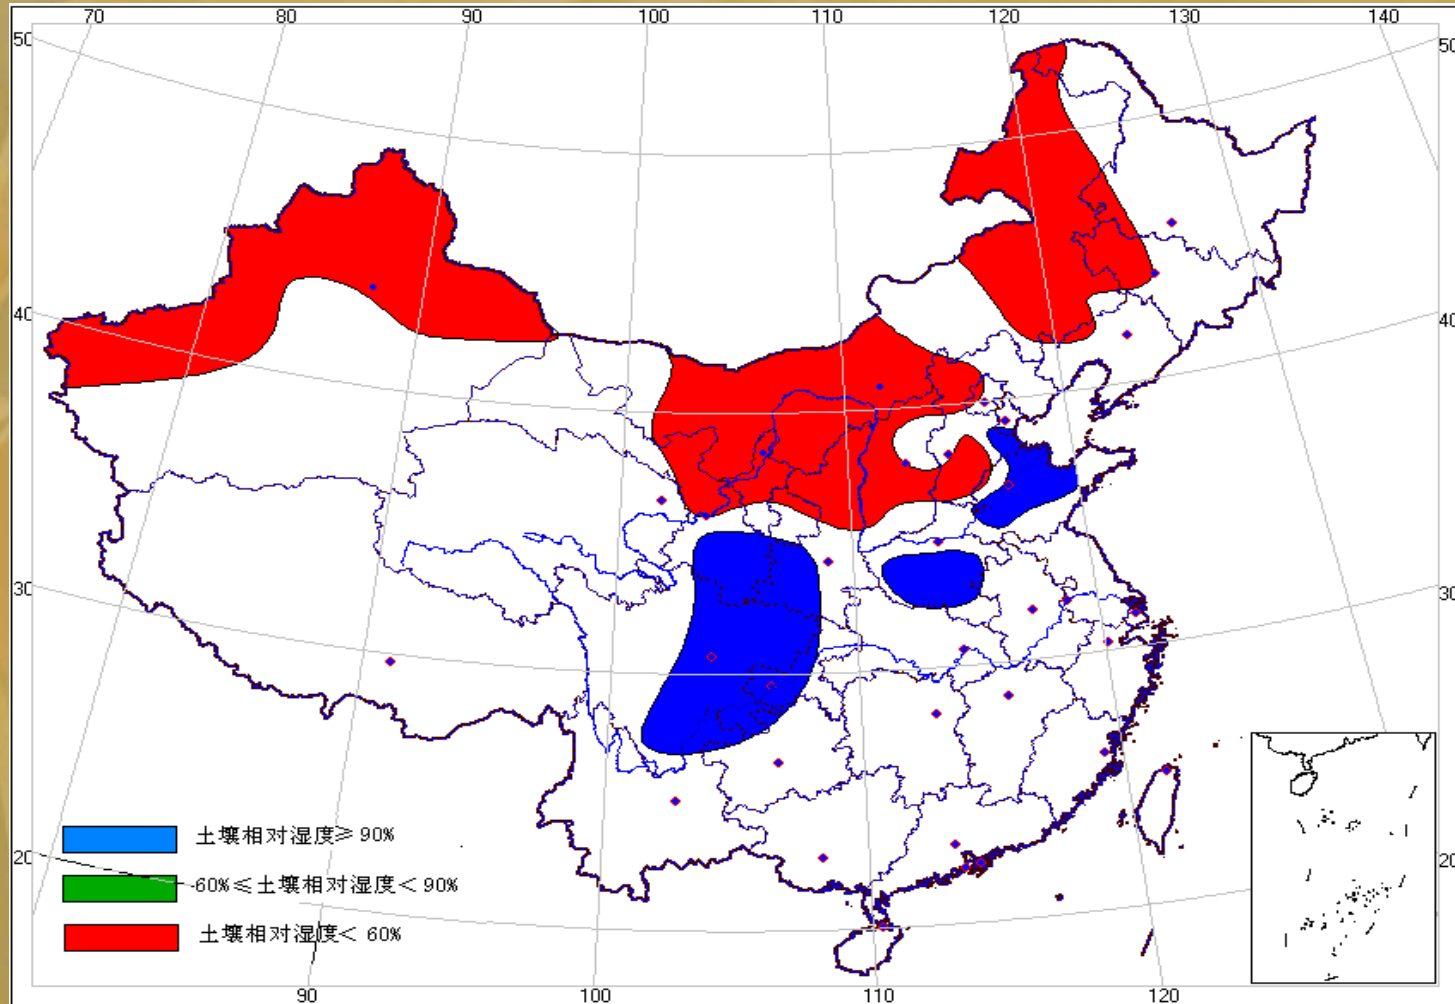

Severe drought

Extreme drought

Drought Evolution in October, 2004

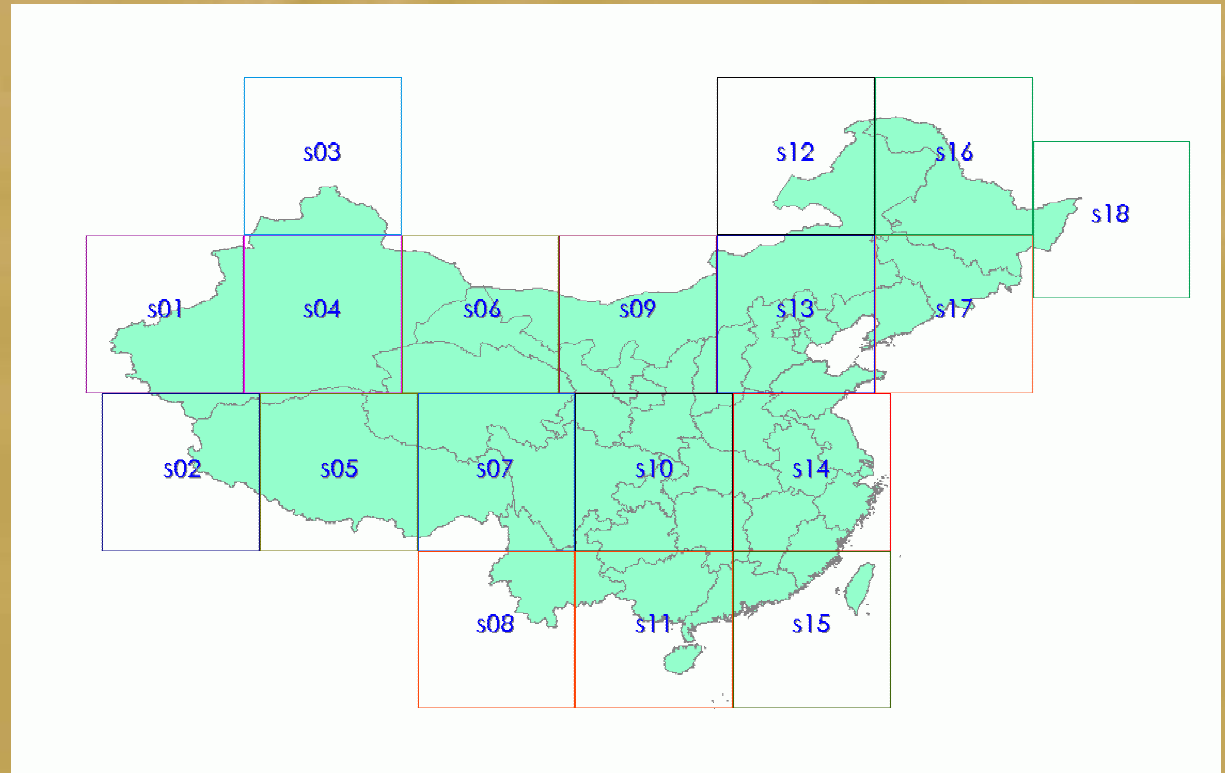

Drought Monitoring according to Soil Moisture Observation on 1, October, 2004

Relative soil moisture $>90\%$, $60\%-90\%$, $<60\%$

Drought Monitoring Using Remote Sensing Technique

Drought Monitoring in nationwide using polar orbit satellite data has been put into routine operation in CMA since 2002.

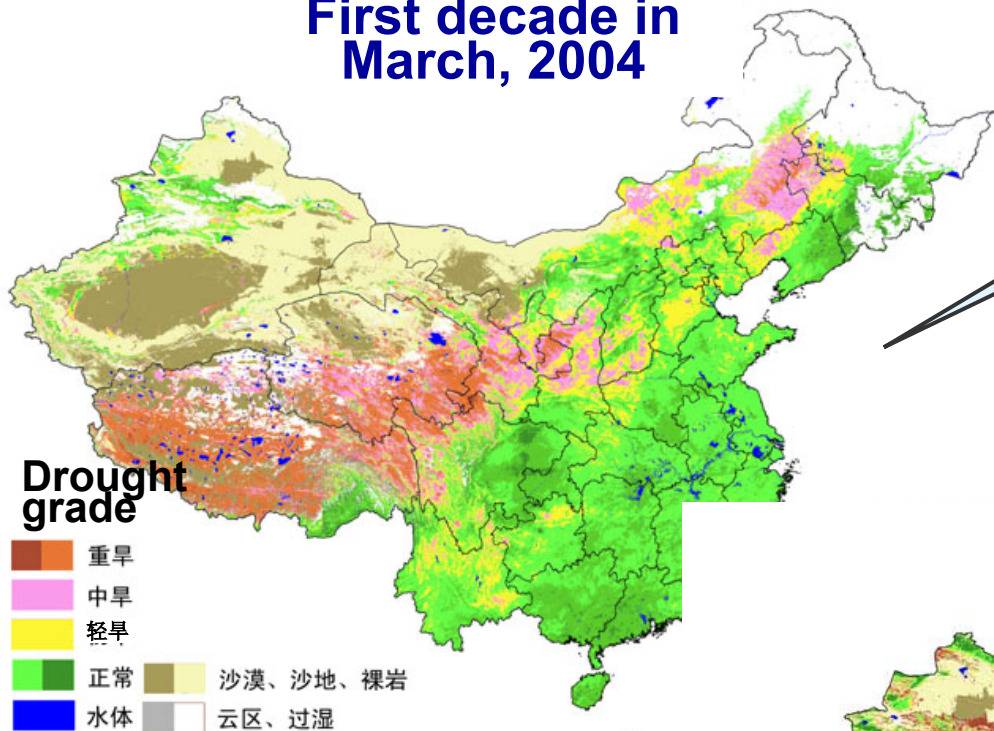

Data source: NOAA-16

polar orbit meteorological satellite

Coverage: nationwide, 18 areas

Period: every 10 days

First decade in March, 2004

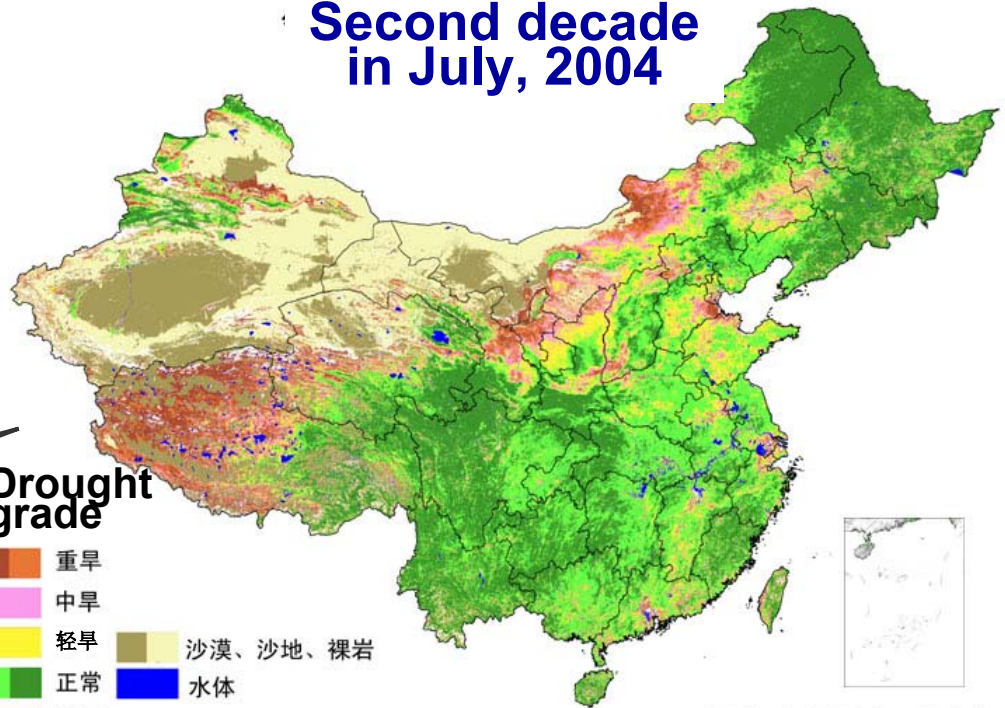

Thermal inertia method

Drought grade

- 重旱
- 中旱
- 轻旱
- 正常
- 水体
- 沙漠、沙地、裸岩
- 云区、过湿

Second decade in July, 2004

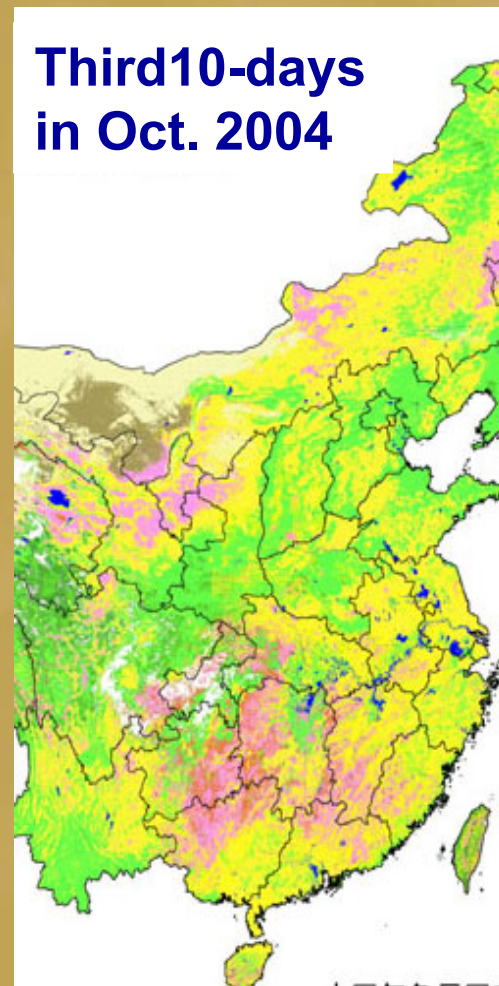

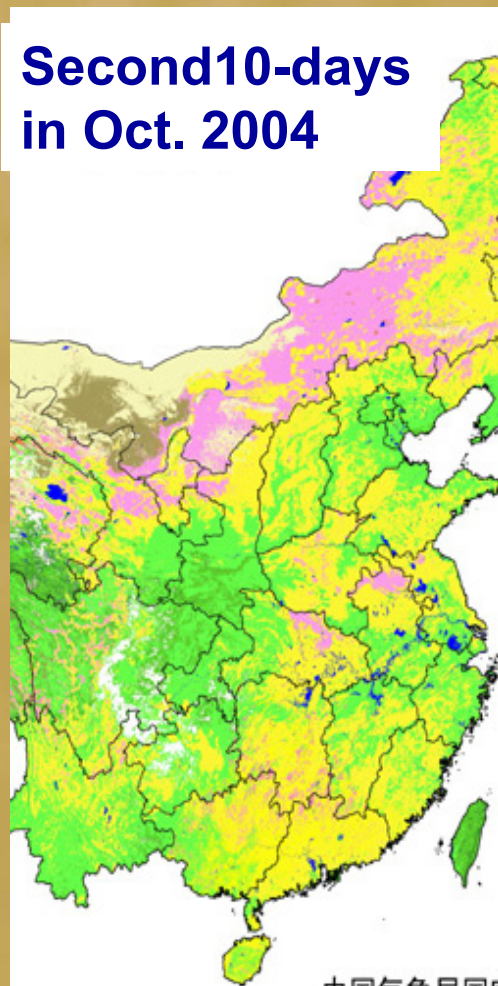

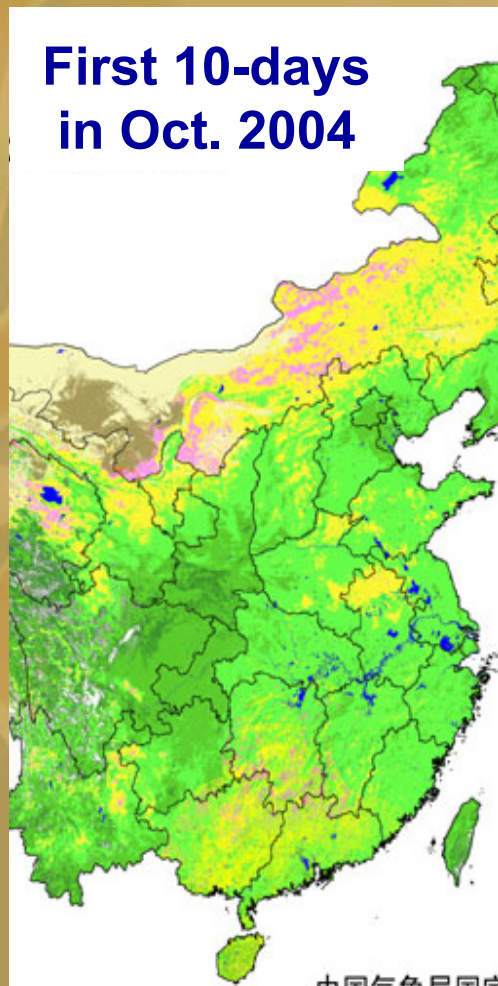

Water supply vegetation index method

Drought grade

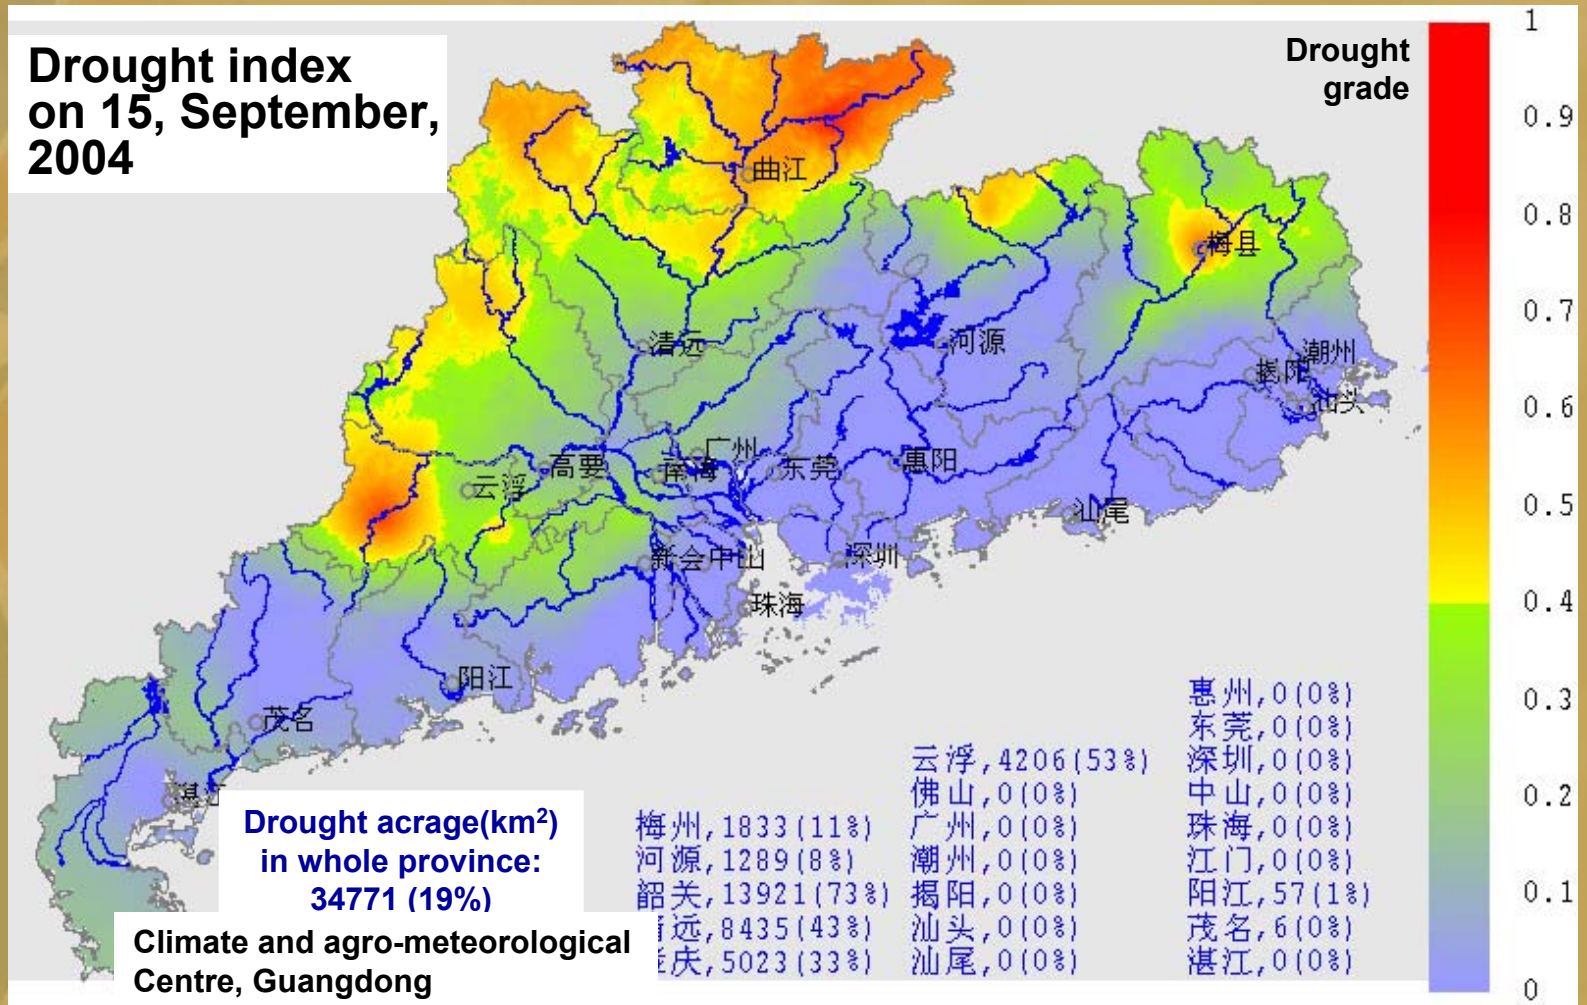

- 重旱
- 中旱
- 轻旱
- 正常
- 水体
- 沙漠、沙地、裸岩
- 云区

Dynamic monitoring of drought in October, 2004

The drought in southern China developed and expanded quickly since October.

Drought Monitoring and Assessment using GIS

Comprehensive experimental site of soil-plant-atmosphere continuum

Rainproof Shed

plants root profile system

(3) Risk Assessment of Agricultural Drought

- **Risk identification of drought in North China**
- **Risk assessment of drought in North China**
- **Comprehensive risk zoning of drought in North China**

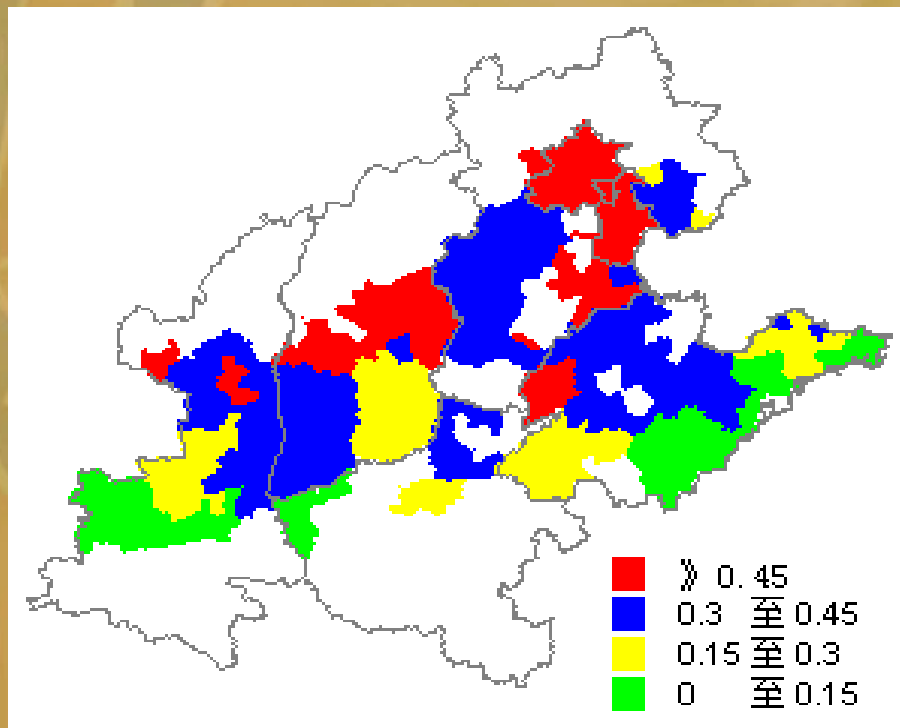

Risk identification: to determine index of risk and damage losses, fit the probabilities distribution functions of disaster indexes and losses

Quantitative index of wheat drought risk

Disaster-Inducing factors	①water stress percent during growing season of wheat(%); ②negative abnormality of precipitation during growing season of wheat(% , leading index) and abnormality during jointing stage (% , secondary index)				
Grade	Light drought	Moderate drought	Drought	Severe drought	Extreme drought
Index①	<20	20~30	30~40	40~70	>70
Yield reduction (A, %)	<9	9~12	12~14	14~21	>21
Yield reduction (A, %)	<9	9~15	15~21	21~40	>40
Index② (leading/secondary,%)	<15/ <30	15~35/ 30~65	35~55/ 65~100	>55/	
Yield reduction (leading/secondary,%)	<10/ <10	10~20/ 10~20	20~30/ 20~30	>30/	

Risk assessment

intensity

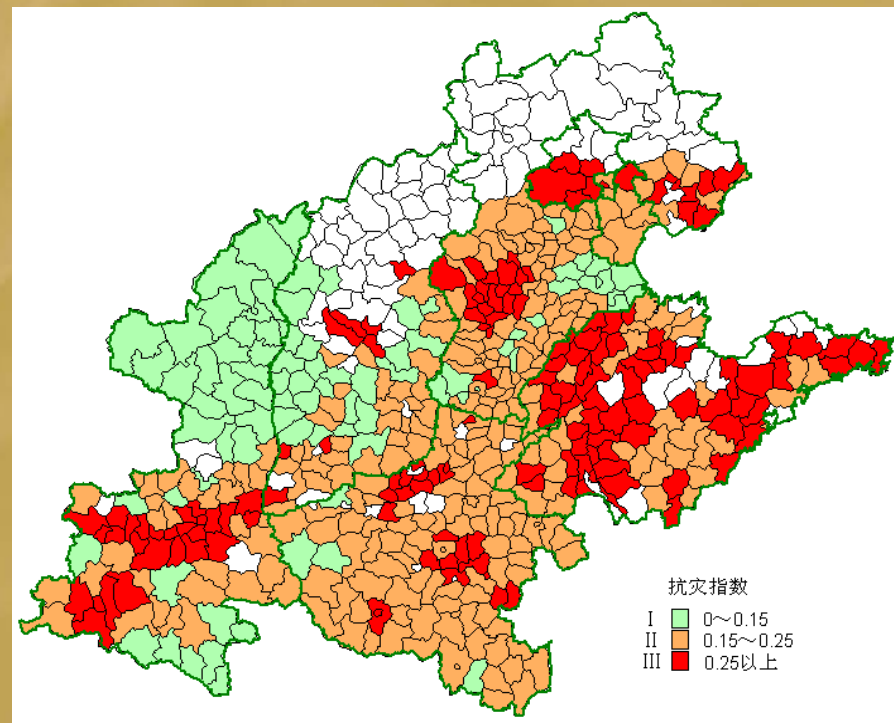

Risk index of water stress

$$I = \sum_{i=1}^n D_i P_i$$

Water stress and their probability

capacity

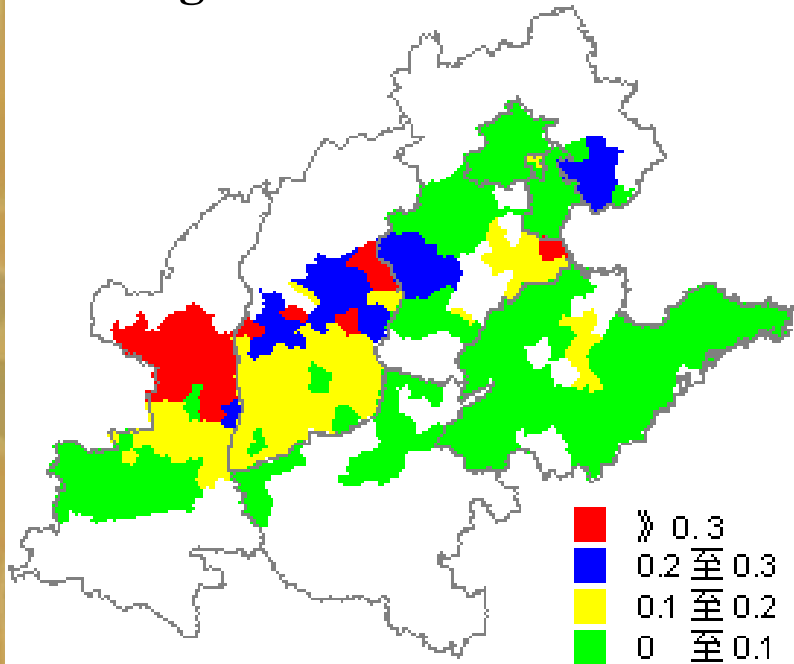

Index of drought-resisting of winter wheat in North China

$$k = \frac{1}{n} \sum \frac{Y_i}{Y_{mi}}$$

Actual yield and potential productivity

Comprehensive risk zoning

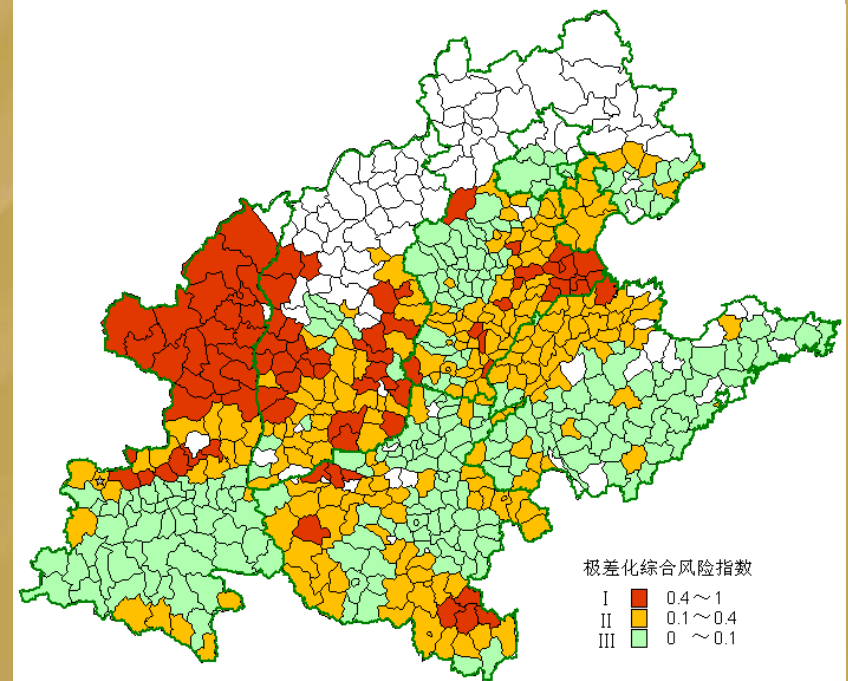

Comprehensive drought risk zoning of wheat in North China

$$M = \frac{1}{a} \sum_{i=1}^n (f_i \times P_i + R_i \times D_i)$$

F, P: water stress and their probability;
 R, D: yield reduction percent and probability; a: time trend coefficients of drought-resisting capacity

Risk zoning of drought loss of wheat in North China

$$M = \frac{1}{k} \times Y \times C \times \sum_{i=1}^n R_i P_i$$

R: yield reduction percent; P: average yield reduction percent; C: variance coefficient of yield reduction; k: index of disaster-resisting

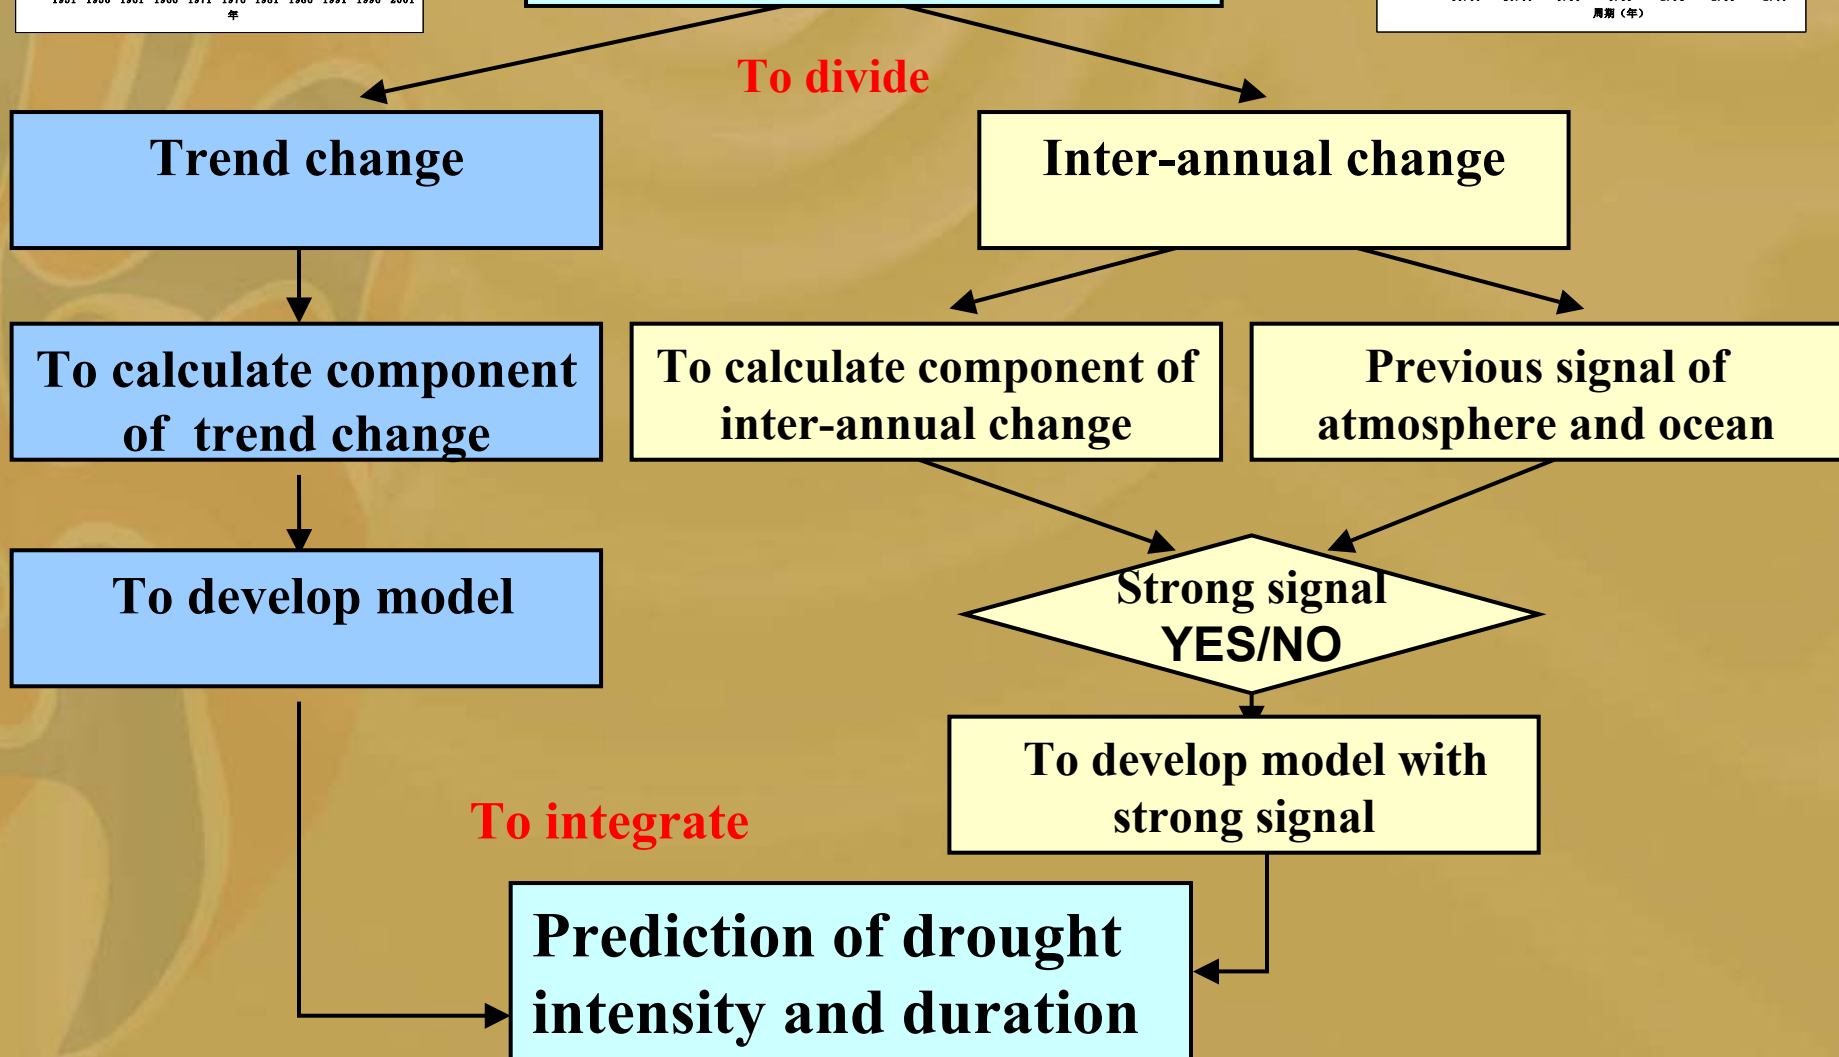

(4) Prediction of Agricultural Drought in North China

- long term prediction of agricultural drought in North China**
- Irrigation scheme for wheat**
- wheat drought prediction based on crop model**

Long term prediction of drought in North China

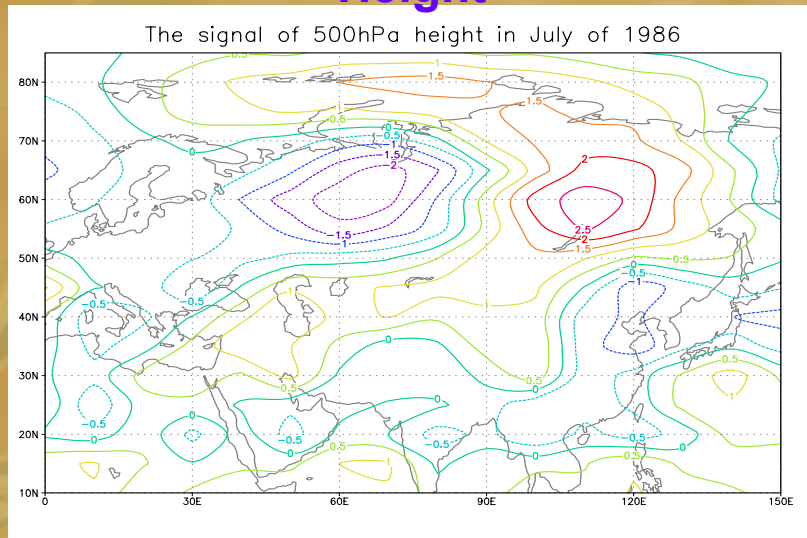

**Drought intensity index of
North China (P-E)**
Predictor

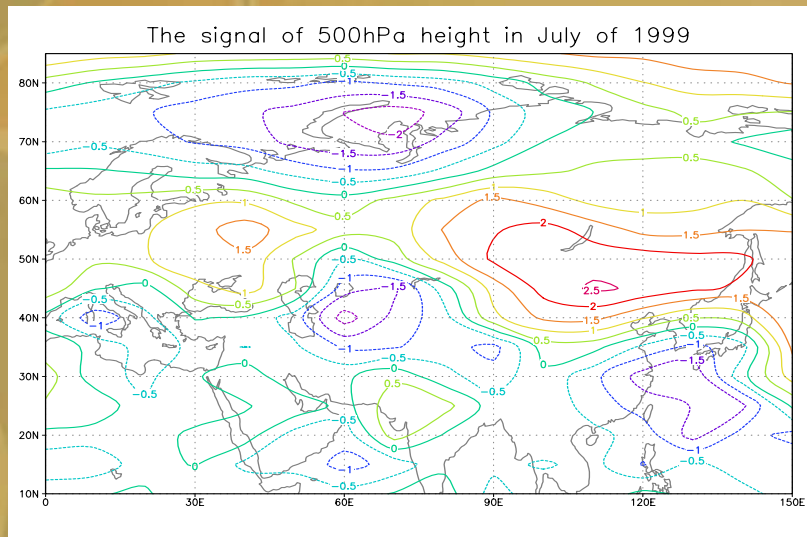

Previous signal of severe drought in North China

Height

SST

Abnormality in height of the Urals and Lake Baikal

Abnormality in Kuroshio, warming Pool and Niño 4

Fitted accuracies (%)

	winter	spring	summer	autumn	average
Advance by 3 months	82	75	90	94	85.2
Advance by 3 months	82	75	87	90	83.5

Validation in 1996-2002 (3 months in advance)

averaged accuracy 71%

Predicted irrigation scheme for wheat in North China

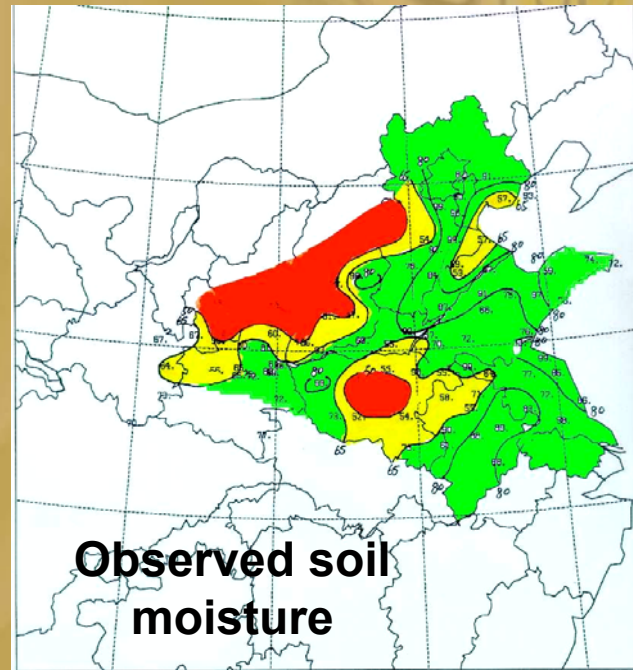

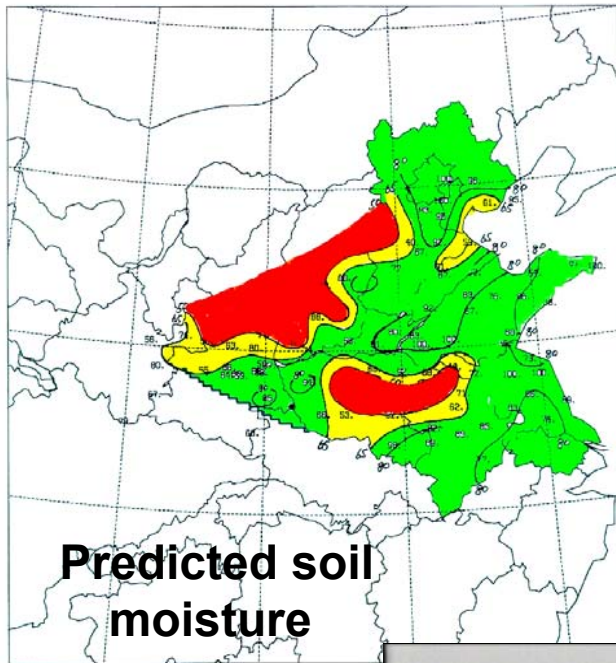

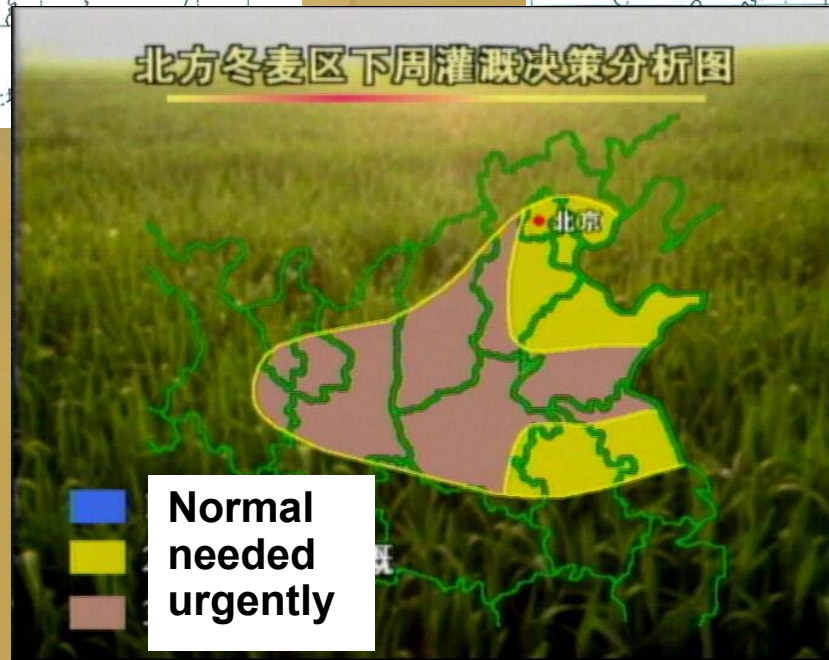

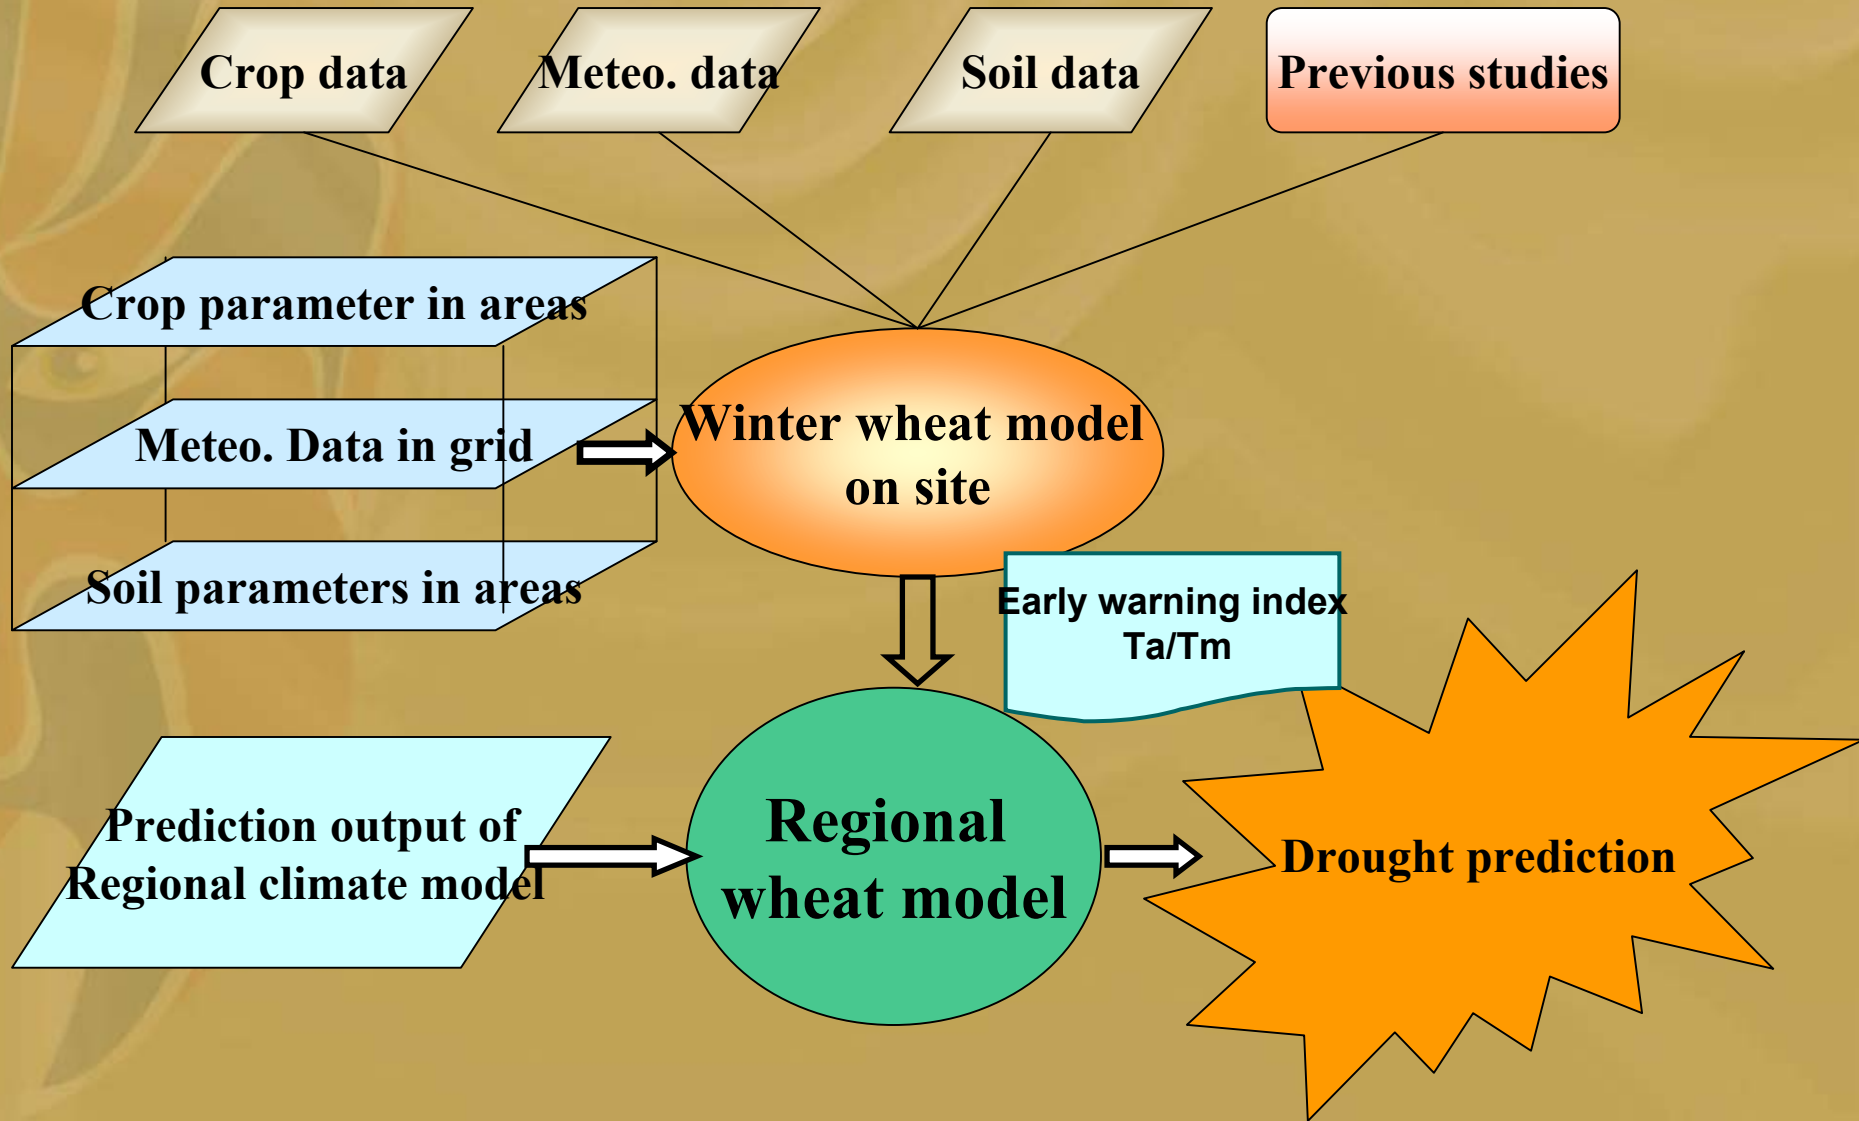

图3 2000年4月8日0~100厘米土壤

厘米土壤湿度(%)实况图

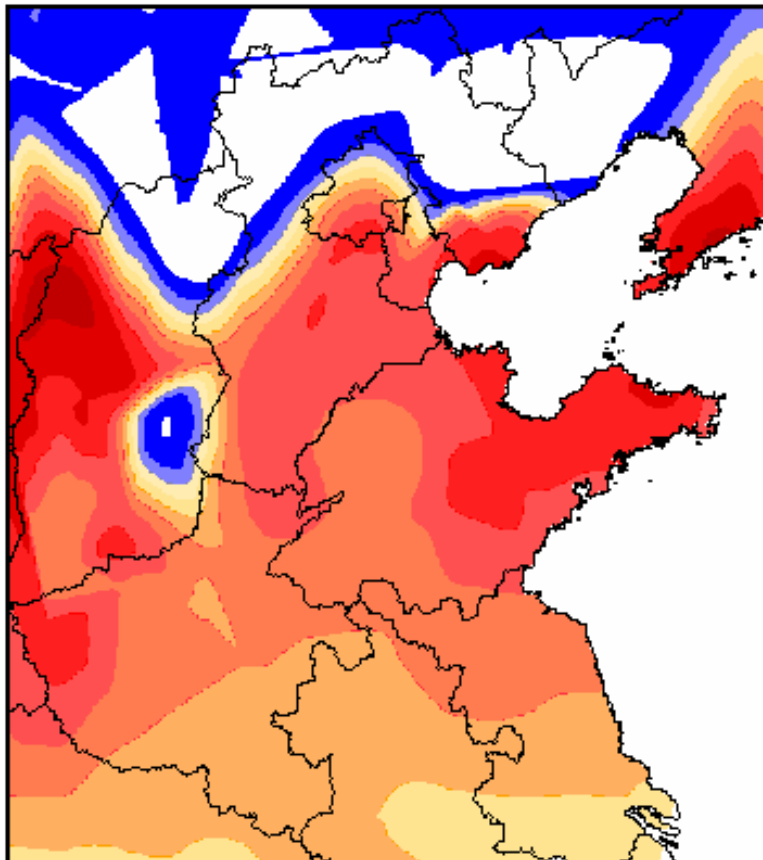

**Irrigation
scheme service
shown on TV
channel**

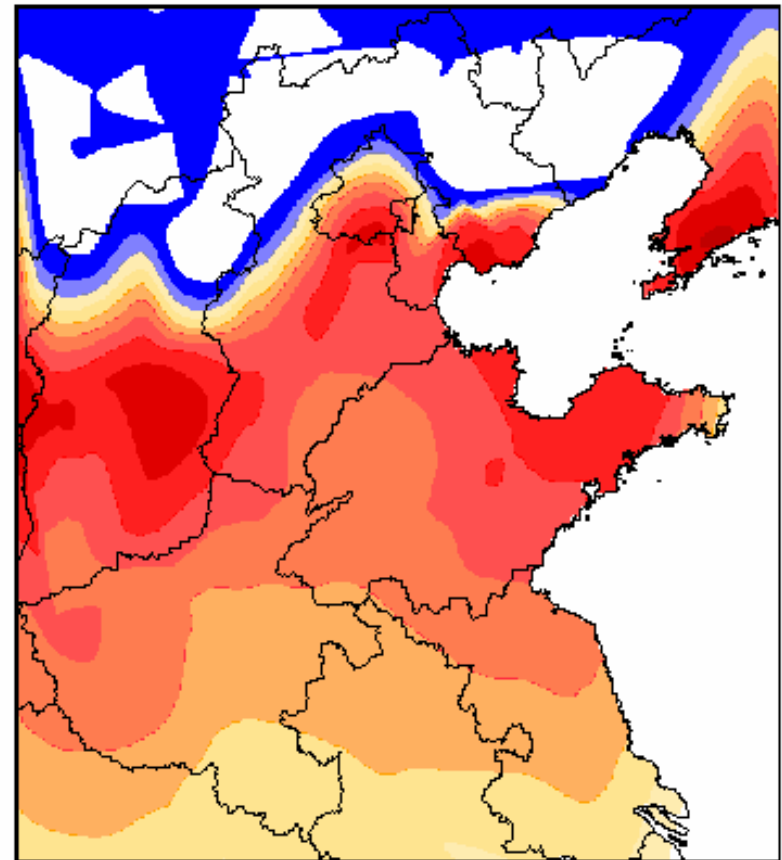

wheat drought prediction based on crop model

Predicted 10-days early warning of wheat drought

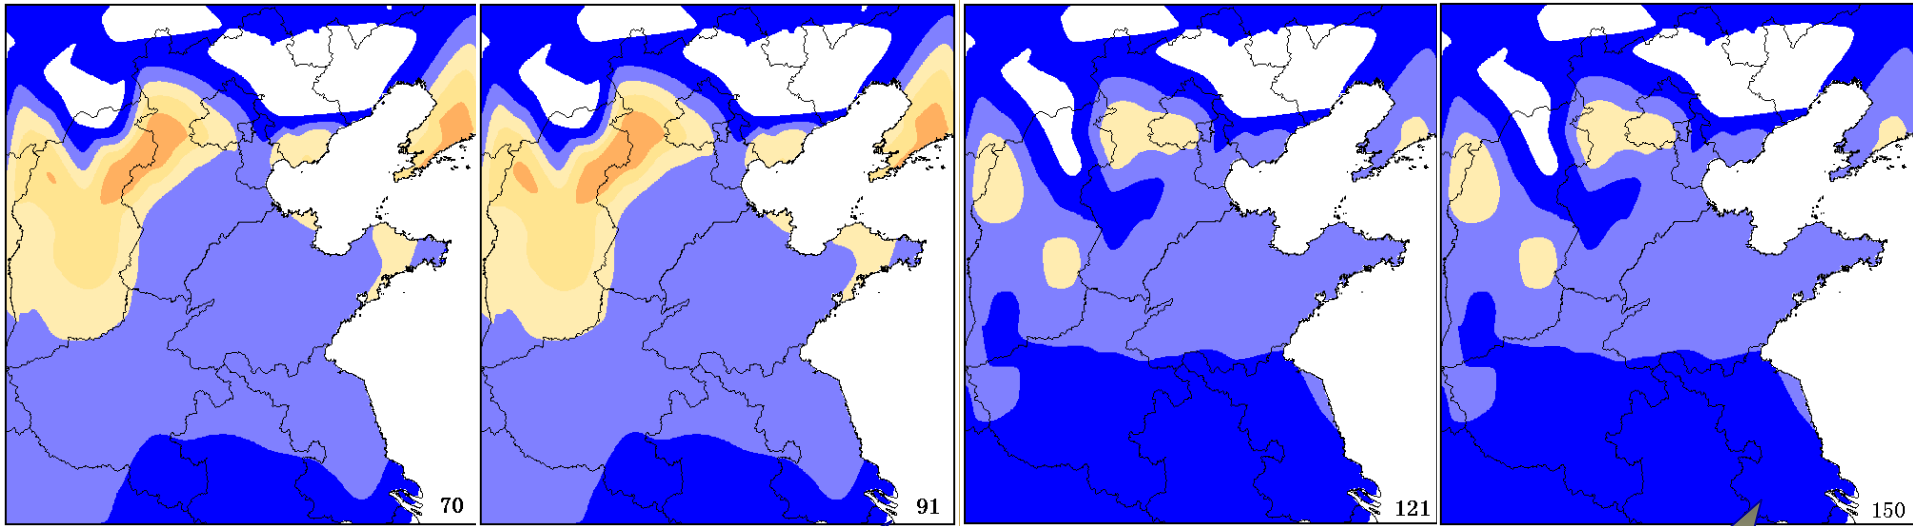

3 Medium, 180

3 Medium, 70

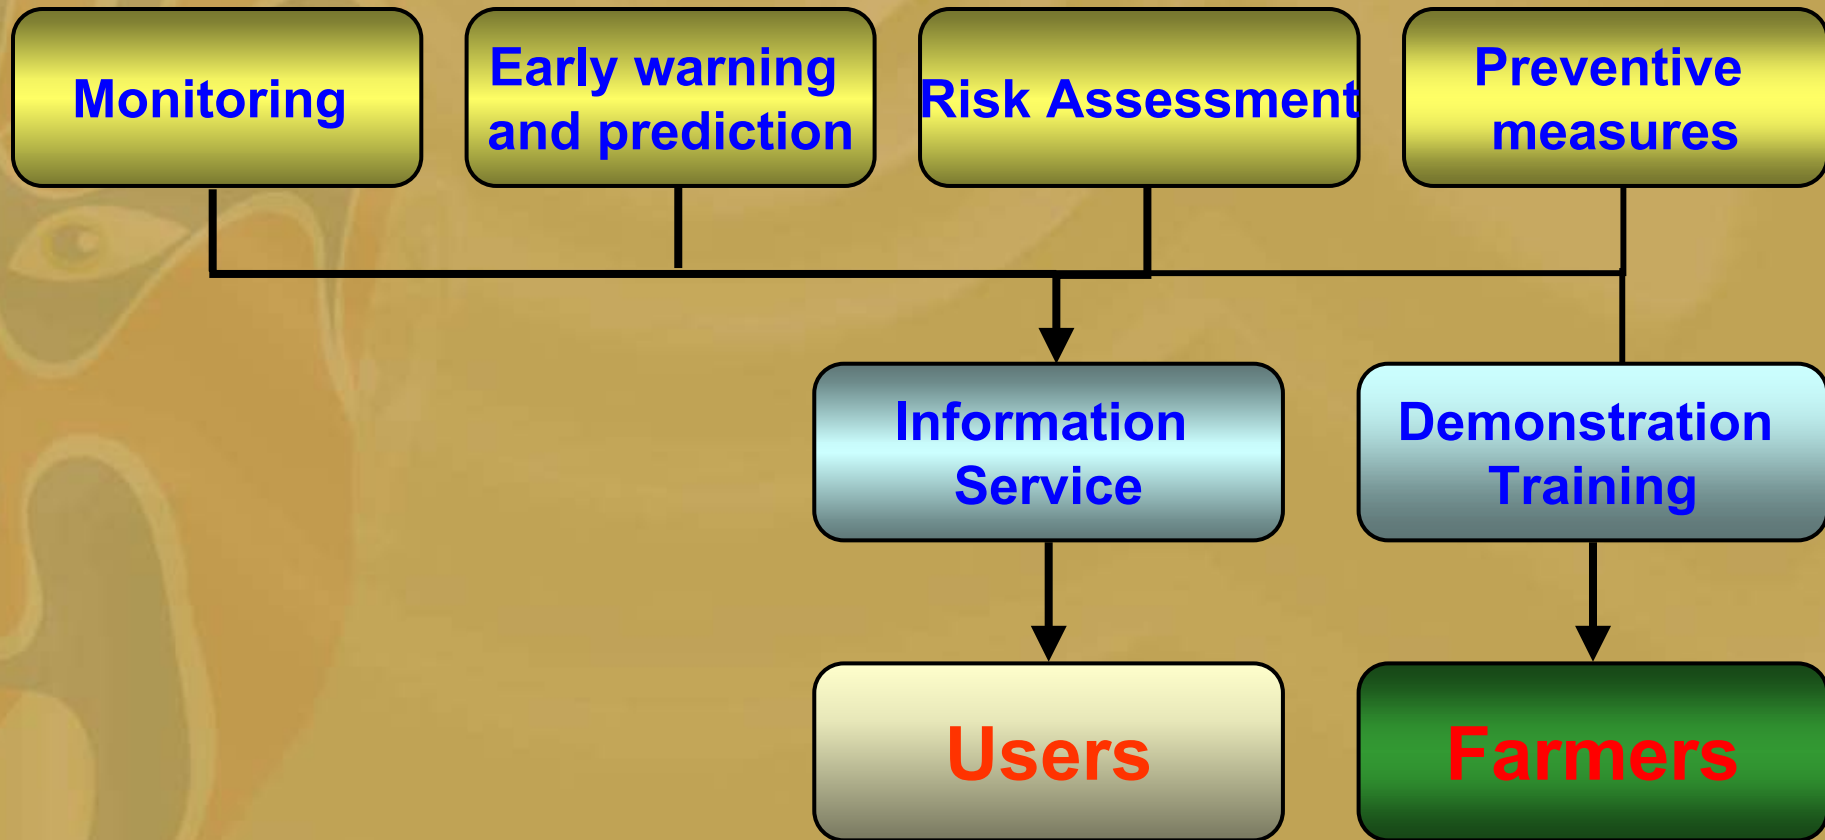

Comparison

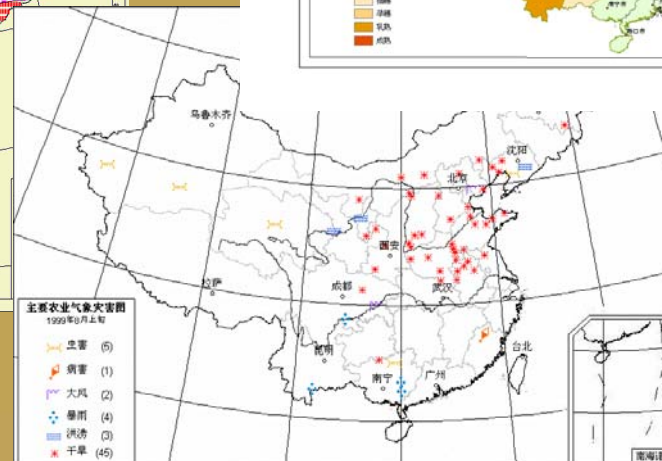

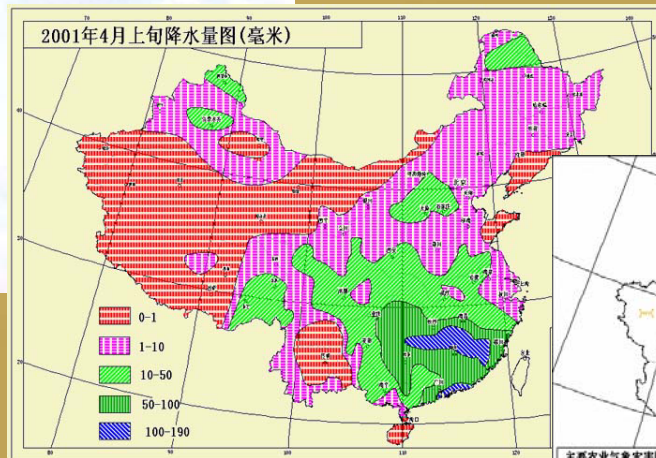

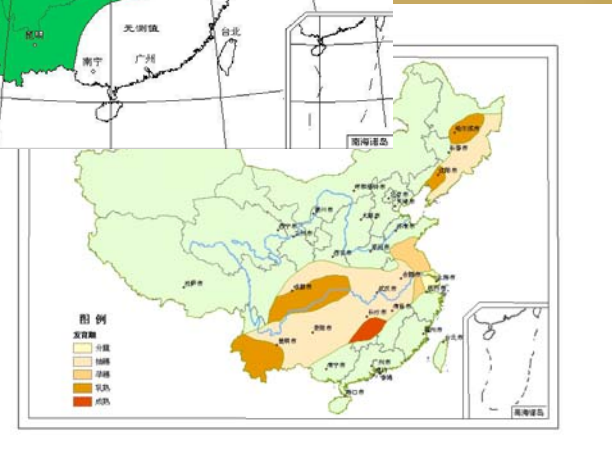

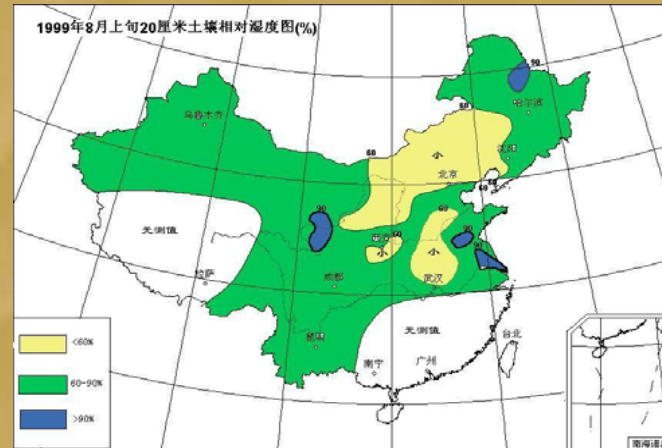

Drought prediction according to forecasted weather elements started on DOY 70,91,121,respectively

Drought prediction according to real data on DOY 150

(5) Meteorological Service for *Mitigating Agricultural Drought*

Providing agrometeorological information services

Propose and popularize practical measures in drought-combating and reducing drought damage loss

- **rationally use of stored soil moisture before sowing**
- **deep plough**
- **straw mulching**
- **optimum irrigation**
- **Prepare multi-functional drought preventing reagents**

straw mulching

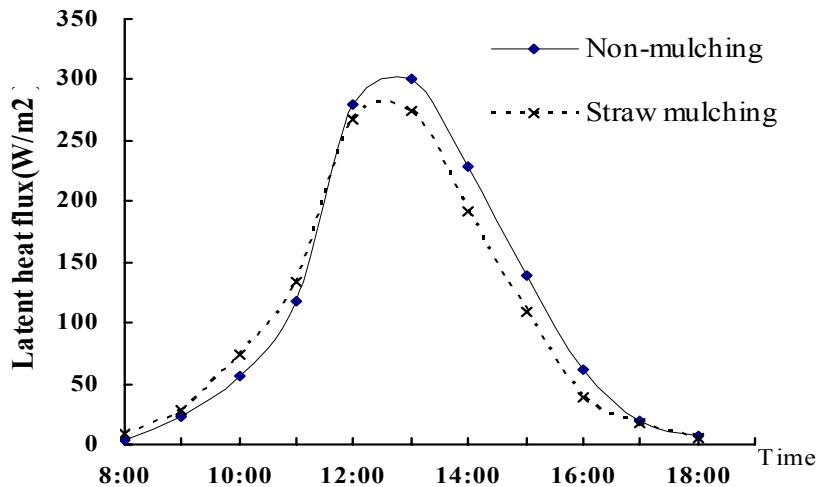

Fig. 3. Diurnal change of latent heat flux in wheat field

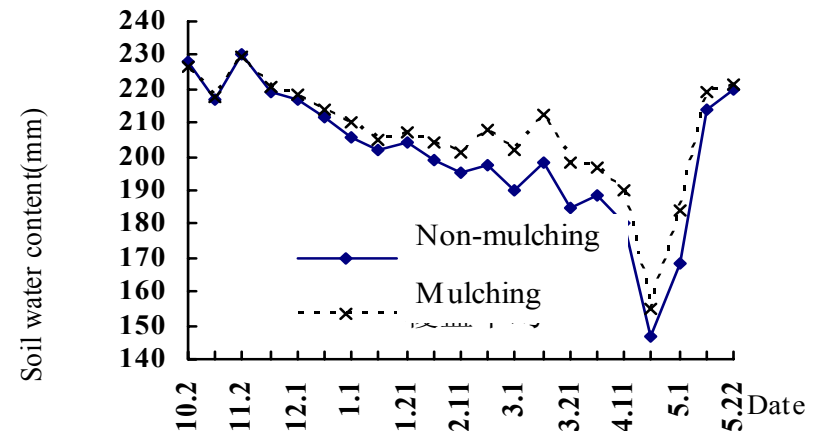

Fig.5. Soil water content in 0-100cm layer under mulching and non-mulching treatment in 1998

Latent heat flux is reduced

Wheat yield increased by 18.5%, water use efficiency was improved by 22.1%.

Preparing and spraying multi-functional drought preventing reagents

To restrain evaporation and
promote crop growth

To spray on plant leaves
during ear sprouting and
grain filling with 1: 1000

popularize agricultural drought mitigation techniques through demonstration, education and training

Handbook are published and issued to farmers.

The training courses are hold.

The drought mitigation techniques are shown on TV station.

The comprehensive techniques of drought mitigation of winter wheat has been popularized about 50000 hectare.

Demonstration field

Training

(6) Conclusions

1. Important role of drought reduction

It is very important to monitor, assess, predict agricultural drought and provide meteorological service on drought information and techniques for mitigating drought in sustainable development.

2. Further improvement is necessary

- Standardization of monitoring
- Data collection and transmission
- Information and products deliver
- Research on drought index, cause and formation of drought, drought prediction, new technique application
- More cooperation

Thank You
